

IdeaFlux

Student ui

1. add a skill like python and evaluate how much they know (eg 60%)

2. let them select a goal (eg ML eng) and guide them through courses and tell them the required skill set

3. show the job openings based on their current skill level

Employer ui

1. can validate the skill gap and tell any on ground parity with the data

For a given course, suggest what to add/change based on the gap (e.g., "Course X doesn't cover Skill Y, which is in high demand — recommend adding it").

Govt. ui

A section that shows what skills/jobs are in demand — pulled from real job postings (and simulated employer survey/placement data where real data isn't available). Compare what skills are in demand vs. what existing courses actually teach. Show which in-demand skills have NO course covering them (the gap).

A filterable view — pick a district/region, pick a sector, and see which job roles and skills are most in-demand there, broken into levels (beginner/intermediate/advanced if you want to simplify, or just "high/medium/low demand"). and show a list/alert of courses where either: (a) nobody's hiring for that skill anymore, or (b) too many people are trained in it compared to actual job openings.

A report/output (even a simple downloadable page) that says, for a chosen district: "here are the top skill gaps, here's what courses/training should be prioritized there."
